ABSTRACT

[0042] The present invention is a remove-able portable alerter for a portable wireless communication host device. The alerter provides a method to receive un-obtrusive alerts from the host device informing the user of incoming notifications. Users are informed of alerts without having to wear, hold, carry or listen to alerts from the host device. The invention provides an alternative to carrying a larger, bulkier host communication device. The alerter provided greater control and manageability of incoming notification enabling them to respond to alerts at their convenience.
